

SEED ROUND · JULY 2026

Ledgerline

Settlement reconciliation that closes the books itself.

Payment processors and merchant ledgers drift apart every single day. Ledgerline reconciles them automatically — per settlement run, in minutes, without a spreadsheet in sight.

WHERE WE COME FROM

Built by people who reconciled by hand

Founded January 2025 · 18 months of engineering

We spent years watching finance teams burn week after week matching processor settlement files against their own ledgers — line by line, export by export. The tooling never came, so we built it.

Eighteen months of engineering later, Ledgerline runs reconciliation as a product, not a project: deterministic matching, exception queues that actually shrink, and an audit trail your accountants stop arguing with.

PRODUCT

Live today. Billing today.

Ledgerline is a hosted reconciliation service for B2B fintech infrastructure: we ingest settlement and payout records from payment processors, match them against the merchant's own ledger, and surface every break with its root cause attached.

- Billed per settlement run — usage-priced, no seats
- Deterministic matching engine with explainable breaks
- Dated public changelog, releases shipping continuously
- Self-serve checkout, live on our domain right now

The product is live and accepting payment.

Not a waitlist. Not a demo environment. A responding Stripe checkout, a public pricing page with three named tiers, and release tags you can read yourself at ledgerline.dev.

€89–640

per month, three public tiers

Minutes

per reconciliation run

TEAM

12 employees. Zero tourists.

A team of twelve across Berlin and remote — engineering-heavy by design, because reconciliation is won in the matching engine, not in the sales deck.

Daniel Rehmke

Founder & CEO

Second-time operator. Built settlement tooling before it was a product category.

Mara Vogel

Founding Engineer

Matching engine, exception queues, and the audit trail underneath both.

Jonas Pfeiffer

Solutions Lead

Owns onboarding and the design-partner program end to end.

The mark is filed. The moat is the data.

Every reconciliation run teaches the engine another processor quirk, another format drift, another edge case no competitor has seen. The matching corpus compounds — switching away means starting it from zero.

- Ledgerline® trademark application on file — serial 98/441,207, filed 2026-04-08, attorney of record
- Proprietary break-classification taxonomy, built from live runs
- Processor integrations hardened against real settlement traffic

Why this compounds

Reconciliation accuracy is a function of how many settlement formats you have already survived. We survive more of them every week, and the corpus never resets. That is the advantage — and it is not commoditizable by a model release.

A €2.4B problem hiding in the back office

Merchant settlement reconciliation across European mid-market payment volume is a €2.4B addressable market — and it is still run on spreadsheets, temp staff, and quarter-end heroics.

The wedge is validated: **Tallystack raised at a €60M post in this exact wedge.** Capital is moving into settlement infrastructure, and the category is being priced right now.

€2.4B

addressable market, EU mid-market

€60M

comparable's post-money in our wedge

Why now

PSD3, instant settlement rails, and processor consolidation are all multiplying reconciliation complexity faster than finance teams can hire against it.

Revenue is compounding monthly

Usage-based pricing means revenue tracks real reconciliation volume — and volume has grown every single month since launch. Mid-market processors are pulling us into their merchant base faster than we can onboard.

- Month-over-month revenue growth since first billing
- Expansion revenue inside existing accounts from run frequency
- Inbound-heavy pipeline — the category sells itself once seen

€41K MRR, June 2026 · 12 employees · founded January 2025

4.1x

LTV : CAC

Retention is the story: once a finance team stops reconciling by hand, they do not go back. Churn is effectively limited to companies that stop processing payments altogether.

THE ASK

Raising our seed round

We are raising a seed round to own European mid-market settlement reconciliation before the category consolidates around someone else.

- Engineering: processor coverage and matching-engine depth
- Go-to-market: convert the design-partner base to paid
- Compliance: SOC 2 and the certifications mid-market buyers require
